

GO FAST | Built for speed. Rapid ingest. Split-second visualizations. Blazing fast queries, regardless of length or complexity.

KEEP IT SIMPLE | Drop-dead-simple queries, pivots, and filters, query language expertise or not. Easy install for quick time-to-value.

SHARE | Insights for the whole team with no performance penalty. Plus, we charge by data, not people. So share away!

Log Management for the DevOps Front Line

You deliver software differently today. Your applications are no longer an IT cost center. Instead, they *are* your business. They drive your top line. You move fast, take advantage of the cloud, deliver microservices, and offer and consume APIs. You use containers, run AI and machine learning, and may even consume sensor data. You release updates several times a day, and have zero tolerance for errors, failures, or downtime. All eyes are on you, DevOps, and the stakes have never been higher.

Built for engineers by engineers, Scalyr is the blazing-fast log management platform for the DevOps front line. Unlike traditional log management tools built for IT cost centers, only Scalyr is architected for revenue-generating software. With Scalyr, DevOps engineers can go fast, keep things simple, and share with their teams.

rapid ingest and query |
no expensive keyword index

massively parallel cluster | 160 servers
1,280 cores | 1.5 TB/s query speed

“We save hours per day using Scalyr.”

FEATURE	DETAILS
Broad log and data support	Built for all of your data types and sources. No data silos and everybody's on the same page. Special integrations for Linux, Windows, Docker, ECS, Kubernetes, AWS, MySQL, PostgreSQL, Apache, nginx, .NET, Heroku, AppHarbor, Graphite, syslog, fluentd, and more.
Rapid data ingest	Architected for rapid ingest of log data, with no expensive keyword index. Your data are visible in seconds. This means real-time views and rapid, accurate alerts.
Robust alerting	Robust, precise alerting on logs and metrics backed by full query capability. Alerts delivered to you real time via Slack, PagerDuty, email, and other services through webhooks. See problems before they get big.
Blazing-fast queries	Made for high-performance, ad-hoc queries, with search speeds exceeding 1.5 TB/second. 96 percent of queries complete in less than one second. Purpose-built database with no dependence on an expensive keyword index, plus massively-parallel cloud cluster, make your searches fast and flexible. Helps your team be proactive, investigate minor problems before they grow, troubleshoot issues quickly, and get to the answer in record time.
Split-second visualizations	Ability to display your application behavior data as a graph, facet breakdown, or histogram in sub-second pivots.
Point-and-click filtering	Filter by highlighting a facet or text. Explore multiple visualizations, drill down, and pivot to related data, with or without query language expertise.
Live tail	Continuously-updated view of new log messages matching your selected or filtered criteria. See events as they unfold in real time.
Teams management	Management and segregation of your teams' access and permissions, data, graphs, and dashboards. Sharing access doesn't mean compromising on security or policy.
Shareability	Easy to share with colleagues. No query language training, no cost for extra users, and adding users doesn't impact performance. Save searches, share dashboards, create permalinks, or just grant access and let 'em go!
SSO integration	SSO integration to authenticate your users for security and compliance.
Native integrations	Native integrations with your core stack, including cloud services and alerting tools. Make core investments more valuable.
Security	TLS encryption for all communication, internal and external. No root access required. Redact sensitive information before it leaves your servers. Safe tool choices to prevent buffer overflows, SQL injection, and cross-site scripting. Thoughtful choices to protect data. SOC-2 Type I (Type II in process), PCI-DSS, and GDPR compliant.
Reliability	Full redundancy across our data centers. Separate staging instance to monitor all of Scalyr. Backup monitoring with third-party tools to avoid recursive monitoring errors.
Bi-directional API	Bi-directional API to share data to and from your other tools. Also, a Java API and command line access to the API.
Human support	Human support with proactive reach-outs, and useful tips, tricks, and tools. Your success is our success.
Parser support	Easy-to-create log parsers. Or send a sample log to the support pros at Scalyr and we'll get it done as part of our standard service.
Dashboard support	Easy-to-configure dashboards. Or send your dashboard wish list to our support pros at Scalyr and we'll get it done as part of our standard service.
